

11. cvičení - Úvod do integrálního počtu

11.1 Několik poznámek na úvod

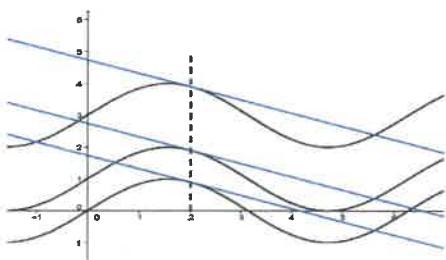

Integrální počet – Jakou funkci musíme derivovat, abychom získali danou funkci $f(x)$?

Například:

$F(x)$	$f(x) = F'(x)$
$\sin x$	$\cos x$
$\sin x + 1$	$\cos x$
$\sin x - 3$	$\cos x$
\vdots	\vdots
$\sin x + c, c \in \mathbb{R}$	$\cos x$

Geometrická interpretace: Pro pevně zvolené x jsou tečny ke grafům funkcí $F(x) + c$ v bodech $[x; F(x) + c]$ pro libovolné $c \in \mathbb{R}$ rovnoběžné, tj. mají stejnou směrnici.

Definice 11.1

Nechť $f(x)$ je definována na otevřeném intervalu I .

Funkce $F(x)$ se nazývá primitivní funkce k funkci f , jestliže pro všechna $x \in I$ platí

$$f(x) = F'(x).$$

Věta 11.1 (O existenci primitivní funkce)

Je-li funkce f spojitá na otevřeném intervalu I , má v I primitivní funkci.

Poznámka: Spojitost je postačující, nikoliv nutnou podmínkou existence primitivní funkce.

Věta 11.2

Je-li F primitivní funkce k f na otevřeném intervalu I , pak funkce $G(x) = F(x) + c, c \in \mathbb{R}$, jsou právě všechny primitivní funkce k f na I .

Označení: Je-li F primitivní funkce k f , píšeme $\int f(x)dx = F(x)$ a mluvíme o neurčitém integrálu.

Úmluva: Symbol $\int f(x)dx$ pro nás bude znamenat některou z primitivních funkcí k f . Každou další bychom dostali přičtením vhodné konstanty.

Věta 11.3

Na každém otevřeném intervalu, který je částí definičního oboru příslušné integrované funkce platí:

[1] $\int c dx = cx \quad (c \in \mathbb{R}),$

[2] $\int x^n dx = \frac{x^{n+1}}{n+1} \quad (n \in \mathbb{R}, n \neq -1),$

[3] $\int x^{-1} dx = \int \frac{1}{x} dx = \ln|x|,$

[4] $\int \sin x dx = -\cos x,$

[5] $\int \cos x dx = \sin x,$

[6] $\int \frac{1}{\cos^2 x} dx = \operatorname{tg} x,$

[7] $\int \frac{1}{\sin^2 x} dx = -\operatorname{cotg} x,$

[8] $\int a^x dx = \frac{a^x}{\ln a} \quad (a > 0),$

[9] $\int e^x dx = e^x,$

[10] $\int \frac{1}{x^2+1} dx = \operatorname{arctg} x = -\operatorname{arccotg} x,$

[11] $\int \frac{1}{\sqrt{1-x^2}} dx = \operatorname{arcsin} x = -\operatorname{arccos} x,$

[12] $\int \frac{f'(x)}{f(x)} dx = \ln|f(x)|.$

Platnost vzorců plyne ze vzorců pro derivování.

Nechť f a g jsou funkce spojité na otevřeném intervalu I a $\alpha, \beta \in \mathbb{R}$. Pak v I platí
