

Instructions to Submit the SQL Scripts

You will upload a ZIP archive with the following files:

Skript_Schema.sql	An SQL script to create the database.
Skript_Data.sql	An SQL script to insert data into the new tables.
Skript_Dotazy.sql	Set of SQL queries described in the document Instructions for a project creation (see dbedu.cs.vsb.cz)

Structure of *Skript_Dotazy.sql*

For each SELECT in the file, there will be a header (a comment) in `/* ... */`. The header contains four pieces of information: **group number**, **query number**, **number of rows** returned by the query and a **description of the query**.

Example 1

```
/*1;1;25;All rows from the table of customers*/  
SELECT CustomerId, Title, FirstName, LastName FROM Customer
```

Example 2

```
/*1;1;25;  
All rows from the table of customers*/  
SELECT CustomerId, Title, FirstName, LastName  
FROM Customer
```

If the header is not in the correct format, then the query cannot be identified and, therefore, it will not be evaluated. When the archive is uploaded, the system automatically checks the queries and it gives you some points. However, the queries are finally checked by a teacher, so the teacher does the final evaluation.

If there are some comments in Czech, you can ignore them – the problems can be discussed in the following tutorial. On the other hand, if you translate the comments (using e.g., the Google translator), you can immediately know, what's wrong. You can upload the scripts as many times as you want.
